

COMPOSITE RESIN CROWN

A composite resin crown is used to rebuild the anterior primary dentition to its natural size, shape and colour. This may be required when teeth have been heavily broken down through dental caries, hypoplasia or trauma. It can also be used to cover areas of discolouration.

Figure. Pre operative dental decay

A composite resin crown encases the existing tooth structure with an adhesive composite restorative material giving it strength and durability whilst restoring the dental aesthetics.

Figure. Pre operative result

The materials are used in a variety of shades to allow for a natural appearance to be achieved, blending with the existing dentition. It can be used in both the primary and the permanent dentition.
